

Access Gen (TSO)

The Access Gen (TSO) features are targeted to give Host Encyclopedia development teams and Release Managers immediate access to the information they need on a day-to-day basis without the need to download. Regardless of the development methodology or phase of the Systems Development Lifecycle your project is in, Access Gen (TSO) integrates seamlessly into your CA Gen project.

Search the way you want to

Access Gen (TSO) provides multiple methods allowing you to make your search criteria as broad or as focused as you need. Use wildcards to return a range of objects, search for changes by date or even supply a specific Object ID.

Find the information you need rapidly

Using any object as your starting point, you are able to navigate around the model by following its associations or run reports against either a single object or multiple objects simultaneously.

Print your reports to a dataset for reference at a later time or to meet compliance requirements.

Adjust the level of detail on objects to suit your preferences.

Key Benefits

- Supports CA Gen projects by increasing productivity
- Easy to use 3270 interface
- Provides access to the Host Encyclopedia without the need to download
- Delivers a full suite of impact analysis tools

Triggers / commented out USE statements are shown depending on Setup options

Access Gen (TSO) gives you the flexibility to analyse the objects the way that is most useful to you.

The Tree report provides a hierarchical view of the object's structure.

The Impact/Usage report may be used to determine the scope of making a view change to an action block or even deleting an attribute.

Setup options allow you to expand or limit the objects included in the result set.

Interactive action diagram browsing on the mainframe

Access Gen (TSO) now lets you expand and contract action diagram views and statements just like you can in the toolset.

Browse the action diagram for a called action block in a new panel and then return to browse the calling action block again.

Additionally you have the ability to Expand All, Contract All and Find from the command line.

```

Change control simplified

The Version report will check objects with or without ancestry depending upon your requirements.

Browse differences to see a detailed report of any changes.

Use the Compare report to evaluate if objects have been migrated to the target model.

The Changed Objects report provides a list of objects, regardless of type, within the specified date range.

```

Simplify your workflow

Access Gen (TSO) enables direct encyclopedia updates without the need to download.

Rename objects or modify exit states without the need to checkout.

Change the business system for action blocks and procedures in one simple step, no re-clicking required.

Publish your common action blocks to a catalog model.

Manage subsets and aggregate sets then let Access Gen (TSO) perform the migration as well.
