

## QA Console

### check | address | implement

*QA Console* brings the power of automated standards enforcement to your projects to accelerate your development process. The highly configurable and extensible software ensures that your applications remain high performing and consistent to make maintenance efficient and effective.

### Quick to install - easy to use

*QA Console* is standalone, fully supported commercial software that is quick to install and simple to use. *QA Console* ships from Response Systems with a set of built in, configurable, "best practice" standards, so you can begin using *QA Console* immediately. You can also write your own checks in house using CA Gen itself with the supplied SDK, freeing you from any reliance on 3<sup>rd</sup> parties to develop a complete solution.

### Faster time to market

Automating the standards checking for your CA Gen applications not only delivers absolutely consistent review outcomes, but dramatically reduces the duration of a critical process in your development lifecycle. This means more rapid delivery, and at the same time improves your QA outcomes, rather than sacrificing them as delivery pressures intensify.

### Reduced development costs

Reviewing application changes is typically performed by your most experienced developers and freeing them not only reduces your development costs but releases them for activities that provide greater value to your team. Where your team comprises new or offsite developers, *QA Console* can ensure your quality standards do not falter.

## Key Benefits

- Instantly confirm your CA Gen code complies with standards
- Reduce time-to-market by shortening the QA cycle
- Ensure that all your applications are coded for best performance
- Enforce your site's standards with offsite development
- Develop your own custom checks – no 3<sup>rd</sup> party reliance

## Configurable to your existing standards

The *QA Console* ships with a built in set of "best practice" base standards that are easily tailored to your own needs and extensible as your standards change and evolve. The configuration capability includes the definition of calling structures, performance, naming standards and the ability to extend and build your own standards checks unique to your environment. *QA Console* supports mature systems and CBD sites, where the requirement to enforce alternate sets of standards across different models or applications exists.

## Compliance and Performance - Peace of mind

In today's rapidly changing world, capacity scaling with new developers or external development partners are approaches increasingly adopted to deliver flexible resourcing solutions to your business. *QA Console* can ensure that your compliance obligations, your QA processes, and especially your CA Gen standards relating to application performance are not jeopardized by adopting these flexible resourcing options.

## See it and try it

We can show you *QA Console* right now - and you can drive it. Through webcast technology we can demonstrate the software, at a time convenient to you. We are able to give control of the mouse, keyboard and software to you directly, so you can understand all of the benefits through using *QA Console* yourself. We can show you the flexibility in configuration, and the ease of use for developers, so you can be confident of automating your QA processes, and immediately gaining the benefits that *QA Console* delivers.
